The following python program uses a function named **scoretograde**, which accepts one integer argument and returns the corresponding letter grade using the standard scale.

```python
def main():
    score = int(input("Enter the numeric score (-1 to quit): "))
    while (score >= 0):
        print (score,"get's a grade of",scoretograde(score))
        score = int(input("Enter the numeric score (-1 to quit): "))
    print()
    print("Thank's for playing!")

main()
```

Write the missing function which will enable this program to work properly.
